Clenergen to Setup Power Projects

Clenergen India Private Ltd., Chennai a subsidiary of Clenergen Corporation (CRGE) has announced its plans for setting up gasification technology based power plants. In the first phase, it is setting up a 16 MW power project in Tuticorin, and 64 MW plant in Karnataka. Both these projects are based on the pyrolysis gasification

technology and will operate on feed stocks harvested from plantations set up by clenergen for cultivation of its own scientifically researched and developed species of grass and tress.

Gasification Technology is used for generating electricity and this technology disintegrates the biomass and releases syngas which provides the source of power for gas turbine generators or can be burned to erase all tar and release steam as a source of power for steam turbine generations, depending upon the technology chosen.
